

 REGRETTABLY ☕ Saturday,
February 24, 2024 ☕ C&C NEWS  Send to Kindle

*Good morning, C&C, and welcome to your jam-packed weekend edition! Today's excellent roundup includes: formerly pro-jab doctor gives hour-long *mea culpa* and endorses Dr. McCullough's most recent peer-reviewed paper; another mystery war blimp floating over U.S. nuclear locations; US military's expensive high-tech battle toys unexpectedly failing in real-world scenarios; and Trump-prosecuting Fani Willis gets barbecued by cell phone geolocation data.*

 You'll enjoy the latest *mea culpa* from a formerly pro-vaccine healthcare professional-slash-social media influencer. Annette Bosworth, MD, also known as "Dr. Boz," has [a popular YouTube channel](#) (600,000 subscribers) and [website](#) focusing on the health benefits of keto dieting and intermittent fasting. It seems like a great channel and I subscribed. Dr. Boz normally covers wellness topics like shopping for a good blood glucose monitor, breaking carb addiction, comparing exercise to intermittent fasting, and things like that.

So it must have shocked many of her subscribers when three days ago she named her most recent YouTube streamer, "[The biggest crime in the history of medicine.](#)"

of GTP technology being applied to vaccination [21]. European regulations mandate the inclusion of an antigen in vaccines, but these immunogenic proteins are not intrinsic to the mRNA vaccines [22]. The GTP vaccine platform has been studied for over 30 years as an experimental cancer treatment, with the terms gene therapy and mRNA vaccination often used interchangeably [23]. This is due to the mRNA products' specific mode of action: synthetic mRNA strands, encapsulated within a protective lipid nanoparticle (LNP) vehicle, are translated within the cells into a specific protein that subsequently stimulates the immune system against a specific disease. Another accurate label would be prodrugs because these products stimulate the recipient's body to manufacture the target protein [24]. As there were no specific regulations at the time of the rapid approval process, regulatory agencies quickly "adapted" the products, generalized the definition of "vaccine" to accommodate them, and then authorized them for EUA for the first time ever against a viral disease. However, the rationale for regulating these products as vaccines and excluding them from regulatory oversight as GTPs lacks both scientific and ethical justification [21]. (Note: Throughout this

YOUTUBE: The biggest crime in the history of medicine (54:56).

That's quite a title for a pro-vaccine doctor. And it quickly became Dr. Boz's highest-watched YouTube ever. But within 12 hours, YouTube de-monetized the show, which was a new experience for the influential advocate. Two days ago, she published a short follow-up video trying to figure out what YouTube terms she violated. She was astounded that discussing a *peer-reviewed paper* could get her punished at this stage of the pandemic.

But let's focus on her original video. It began with a bang:

Dr. Boz explained that it was the relentless pressure of subscriber's jab comments — comments she pretended to ignore but actually noticed — that kept her attention secretly on the science related to the vaccines.

Then she introduced Dr. McCullough's (and five other authors including Jessica Rose and Steve Kirsch) latest 40-page, peer-reviewed article that published in the Cureus open-access journal on January 24th. The study was neutrally-titled, "COVID-19 mRNA Vaccines: Lessons Learned from the Registrational Trials and Global Vaccination Campaign." Here's how she described the study:

For regular C&C readers, there isn't anything particularly surprising in the McCullough paper, which methodically and professionally walked through all the issues we currently know about, starting with the statistical tricks that Pfizer and Moderna employed in their early clinical trials to exaggerate the benefits

and whitewash the risks, and then tackled thornier issues such as why the jabs are actually *genetic therapies* and are not actually vaccines. It was the carefully-documented way the authors addressed these problems that finally penetrated Dr. Boz's cognitive defenses:

Ultimately, the unyielding weight of McCullough's data and logical analysis pressed Dr. Boz to self-reflect. She started by explaining how Pfizer and Moderna were able to conclude efficacy and safety only because they'd restricted it to healthy trial participants aged 18-55. Later she combined all these issues — the lack of a spike shut-off, the obviously faked trials, and Dr. McCullough's carefully-documented findings of spike protein in the heart muscles of autopsied sudden-death patients — Dr. Boz took all of that and clearly experienced a painful change of heart:

There's plenty more in the video. To keep it a manageable length, I omitted several other interesting parts, like where Dr. Boz explained how trusted gatekeepers like herself were manipulated into towing the party line and not asking questions. As I said, you'll enjoy hearing the thought process of a proud pro-vaccine doctor being convinced to humble herself and make a public apology.

What we don't see though are all the doctors and health professionals who aren't social media influencers like Dr. Boz, but who also have been convinced by Dr. McCullough's careful, thoughtful, peer-reviewed article. Dr. McCullough is another one we should be grateful for. I'm not minimizing the contributions of the other authors, but Dr. McCullough was the most-published cardiologist in history. He knows a lot about how to get papers peer-reviewed and published, even regarding controversial topics.

Now ... what's that smell? Is somebody barbecuing? It smells like they're roasting a Fani Willis somewhere.

🔥 Here we go again! Late yesterday, the Hill ran a breaking story headlined, "[US tracking high altitude balloon over Midwest.](#)" That's all we know so far. To scramble all the fighter jets and everything else, *something* must be suspicious about this giant floating gasbag. And I'm not just talking about AOC.

Stay tuned.

🔥 Yesterday I tested the major A.I. platforms and confirmed for myself that Google's new AI, Gemini, not only believes but *promotes* the long-discredited theory of Minor Attracted Persons, which posits that pedophilia is completely
